

Insulate your cavity walls and keep the heat at home

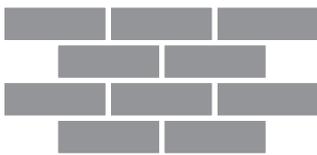

Cavity wall insulation is a simple and effective way to reduce your heating bills – and have a warmer home.

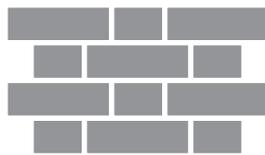

If your home was built after the 1930s, the chances are that its external walls are made of two 'skins' with a small gap between them. This means they are 'cavity walls' and the gap between them can be filled with insulating material to stop the warmth escaping to the outside.

To find out whether your home has cavity walls, look at the brick work. If your home has cavity walls, the bricks will normally have a regular pattern (left). If your home has solid walls, the bricks will have an alternating long-short-long-short pattern (right).

Cavity wall

Solid wall

Cavity wall insulation can cut your heating bills so much that it will pay for itself quickly. What's more there is financial help and support available to help people pay for cavity wall insulation. For professional installers, the job is simple, quick (about two hours) and makes no mess.

Insulation keeps the heat indoors. People who insulate their cavity walls notice the difference in their comfort and in their fuel bills

Is my home suitable?

Generally speaking, your home will be suitable for cavity wall insulation if:

- the external walls are unfilled cavity walls
- the masonry and/or brick work is in good condition
- your cavity is at least 35mm wide (or 50mm for some forms of insulation)

If your home was built in the last 10 years it is likely that the cavity is already insulated. Some walls exposed to extreme weather and driving rain can also be unsuitable for cavity wall insulation. In all cases if you're thinking about cavity wall insulation, always check with a registered installer who will assess whether your home ticks all the right boxes. If your home is not suitable for cavity wall insulation, why not think about **solid wall insulation** (see other leaflet)?

NB: Filling cavity walls is not a DIY job. It should always be carried out by a registered installer who is a member of the National Insulation Association (NIA), the Cavity Insulation Guarantee Agency (CIGA), or the British Board of Agrément. You should also make sure that your installer is signed up to a code of professional practice like those provided by the NIA, and that the installation is guaranteed for 25 years by CIGA.

How much money will I save if I fill my cavity walls?

Cost	£500 (typical)
Annual saving	£135
Payback time	4 years (typical)
CO₂ saving per year	550kg

These are **estimated** figures based on a gas-heated, 3-bed semi. For larger homes, or those heated by electricity or oil, the savings will be significantly higher. Subsidies for cavity wall insulation will no longer be available when the Carbon Emissions Reduction Target (CERT) comes to an end in 2012, but financing options for energy efficiency improvements like cavity wall insulation will be available under the forthcoming Green Deal and ECO. See www.cse.org.uk/greendeal for more information.

"Insulating your cavity walls can reduce condensation inside the house. And you'll also be cutting CO₂ and helping to tackle climate change"

Tips for lower energy bills

Happy paying your electricity and gas supplier more money than you need to? Thought not. Here are 10 ways to cut your bills ...

1) Give your clothes a day in the sun; and give your tumble drier a break. Clothes dried in the fresh air feel great, and there are drying days in winter, too.

2) Keep the oven door shut as much as possible; every time you open it, nearly a quarter of the heat escapes.

3) Catch 'em young. Encourage your children to switch off electric toys and lights that they're not using. They'll soon get the hang of saving energy.

4) Be a friend to your freezer. Defrost it regularly to help it run more efficiently.

5) Buying a new washing machine, TV or dishwasher? Look out for the Energy Saving Trust logo.

6) Don't over-fill the kettle (but do make sure you cover the metal element at the base).

7) Dodge the draught! Fit draught-excluders to your front door, letter box and key hole, and draw your curtains at dusk to keep the heat in.

8) Turn your heating down by 1 degree. You'll hardly notice the change in temperature, but it'll make a big difference to your heating bill.

9) Wait 'til you have a full load before doing a wash. Two half-loads use more energy (and water) than one full load.

10) Sleep tight. Make sure all the lights are turned off when you go to bed. If you want to light a child's room or a landing, use a low-wattage night light.

The SEACS* project brings together three UK and two French local authorities – Devon County Council, Dorset County Council, Wiltshire Council, le Conseil Général des Côtes d'Armor and Lannion-Trégor Agglomération – to tackle the energy challenge that is faced on both sides of the channel.

The aim of the project is to create opportunities for individuals, households, communities, schools and local authority buildings in both UK and France to reduce their energy consumption, implement energy efficiency measures and use clean/renewable energy where possible. The project will raise awareness of climate and energy issues and encourage long term behavioural change towards energy usage. Cooperation will be the ethos of the project and participants will have the opportunity exchange and learn from each other.
